Analysis:

👉 AR-based Smart Menu (Augmented Reality Menu)

1️⃣ QR Code → Opens Web App

From your first image:

He scans a QR code

It opens a website like: tgo.4d-menu.com

👉 This is just a web-based menu (like Swiggy/Zomato UI)

✓ Categories

✓ Prices

✓ Items

Nothing special yet.

2️⃣ Selecting Food Item

From second image:

He clicks “Burgers”

Sees:

Item name

Calories

Price

👉 This is normal frontend UI (React / Web app)

3️⃣ “View in AR” option

From third image:

Button: “View in AR”

This is where things get interesting 👇

👉 When he clicks:

It activates phone camera

Uses AR technology

4️⃣ AR (Augmented Reality) Food View

From last image:

Food appears on table

Labels show:

Tomato → Vitamin C

Chicken → Protein

Avocado → Good fats

👉 This is done using:

AR libraries like:

WebXR

ARCore (Android)

ARKit (iPhone)

⚙️ How this actually works (technical breakdown)

🧩 Components used:

1. 🌐 Frontend Website

Built using:

React / Next.js

Shows menu UI

2. 📦 3D Models

Food is NOT real

It's a 3D model (.glb / .usdz file)

Example:

Burger model created in:

Blender / 3ds Max

3. 📱 AR Engine

When user clicks “View in AR”:

Phone camera opens

Detects surface (table)

Places 3D object

4. 🏷️ Info Overlays

Labels like “Vitamin C”, “Protein”

Just UI elements attached to 3D object

<u>Summary:</u>

Scan a QR code 📱

View menu on phone

See food in 3D using AR

Check calories & nutrition

Make better decisions before ordering

⚙️ Technical Explanation

It is a web-based application integrated with AR (Augmented Reality) that:

Uses QR code to access menu

Displays food items dynamically

Uses WebXR / ARCore / ARKit to render 3D models

Overlays nutritional data in real-time
